GoTogether

Social networks connect people digitally, but rarely foster genuine relationships. Users are looking for real-world encounters, lasting friendships, or at least deeper social interactions.

We present **GoTogether**, a real-world social networking app that helps users find like-minded people nearby for shared activities. The app is designed to facilitate meaningful connections and enhance social experiences.

Collaboration Tools and Repository

The **GitHub repository** is used for code sharing and version control. The whole project code and documentation can be found at GitHub s-voelkl/GoTogether. The correlating **OTH-AW GitLab** project can be found at GitLab, where the project is mirrored for submission, but access is restricted to members of the project team.

The **Taiga** project management tool is used for task management and sprint planning; it can be accessed at Taiga.

Textual discussions and communication are conducted via **Discord**.

During meetings, **Etherpad** was often used for live note-taking and collaborative editing.

Figma helped with the design of the web application and can be accessed at Figma, though a login might be required.

LICENSE

The source code of this project is released under the **MIT License**. For more information, see the license file `src/LICENSE`. The documentation and all accompanying materials are released under the **CC-BY 4.0 License** (see `documentation/LICENSE`).

USAGE

The project setup and **usage** instructions can be found in the USAGE.md document.

Requirement Definitions

The underlying **research and problem definition** for the GoTogether project can be found in research-problem-definition.md.

From there, the **personas** in personas.md were derived, though especially the personas Karin (54) and Tom (29) highlight the main target groups for the app. The basic app idea is described in app-idea.md. Based on

this idea, the **user stories** and the reduced **MVP** user stories are defined in user-stories-mvp.md. The **SMART** goal definition for the project can be found in smart-goal.md.

Architecture Description

The **architecture description** in architecture.md describes the overall architecture of the GoTogether app, including the main components, interfaces, and technologies used. It also includes a high-level overview of the system design and the rationale behind architectural decisions.

Other Documents

The **scrum notes** in `docs/scrum-notes/` contain the documentation of the first Scrum meetings, and the full exports of the Sprint Retrospectives.

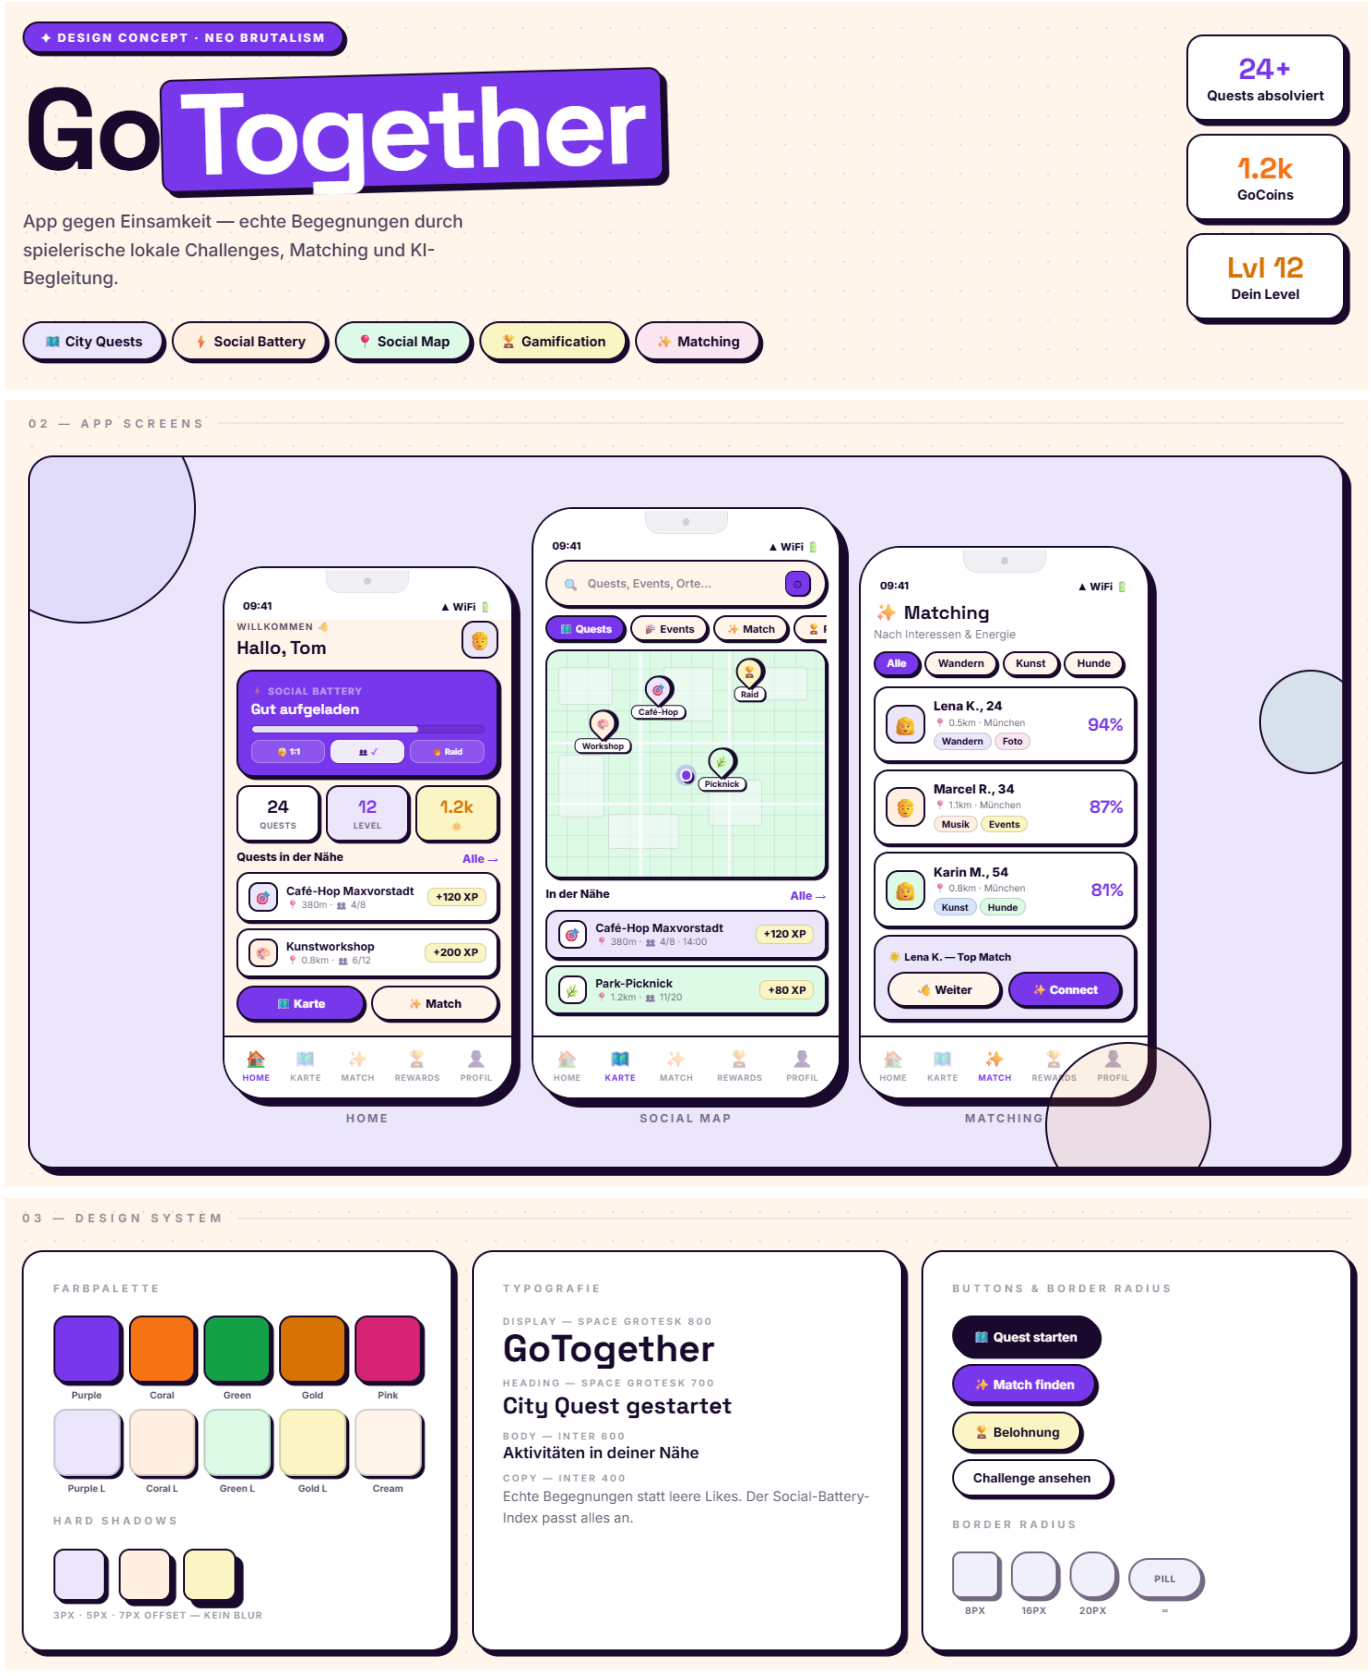

Diagrams were first created with Draw.io (`docs/diagrams/archive`) and later with PlantUML (`docs/diagrams/src` and `docs/diagrams/out`) to better fit the rapid development and changes in the project.

A **user guide** in user-guide.md gives an overview of how to use the GoTogether app as a user.

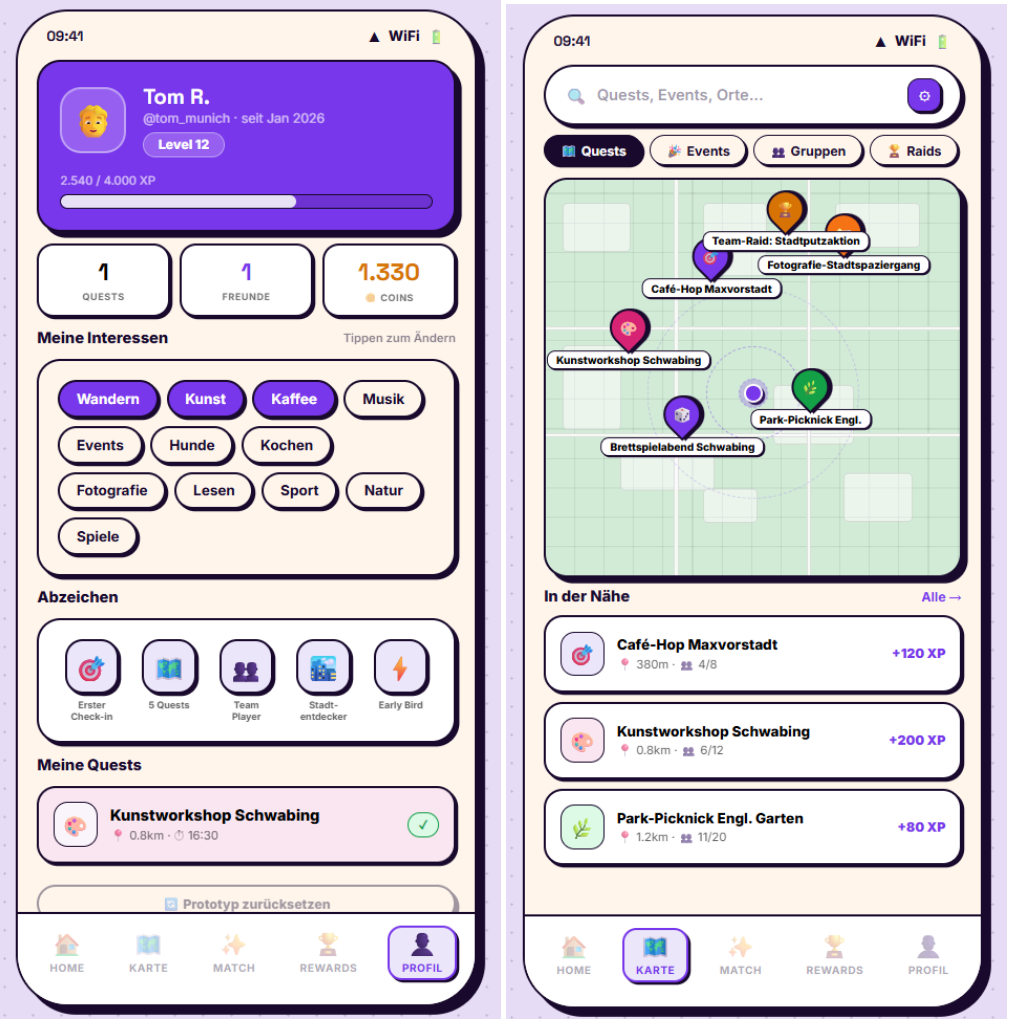

The **artifacts** in `docs/artifacts/` contain the historical development artifacts of the project, including moodboards, initially created demo apps and other early-stage design and development materials.

Development Showcase

Design Phase: Moodboard (`docs/artifacts/04-moodboard-web-neo-brutalism`)

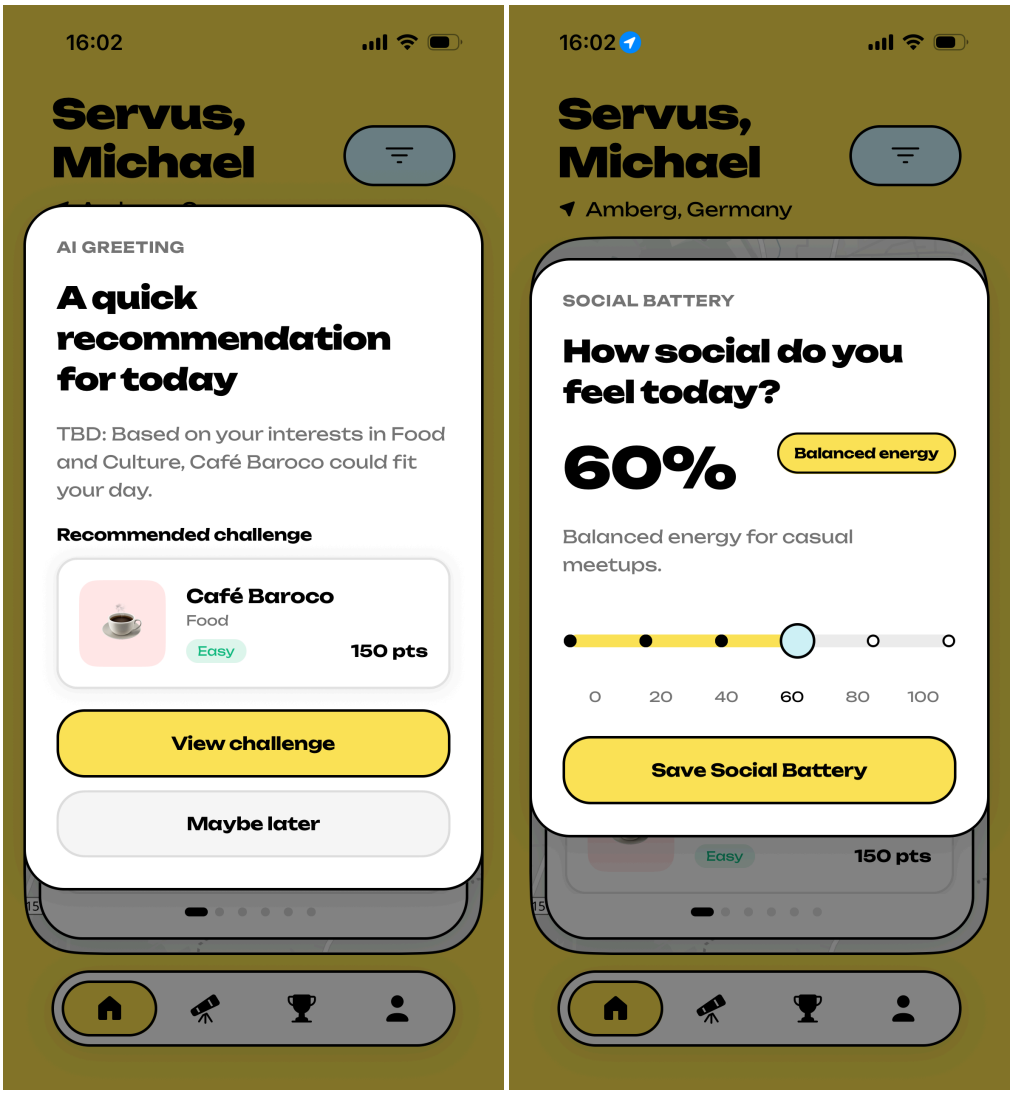

Design Phase: Initial Demo App (`docs/artifacts/05-demo-mobile-vanillaJS`)

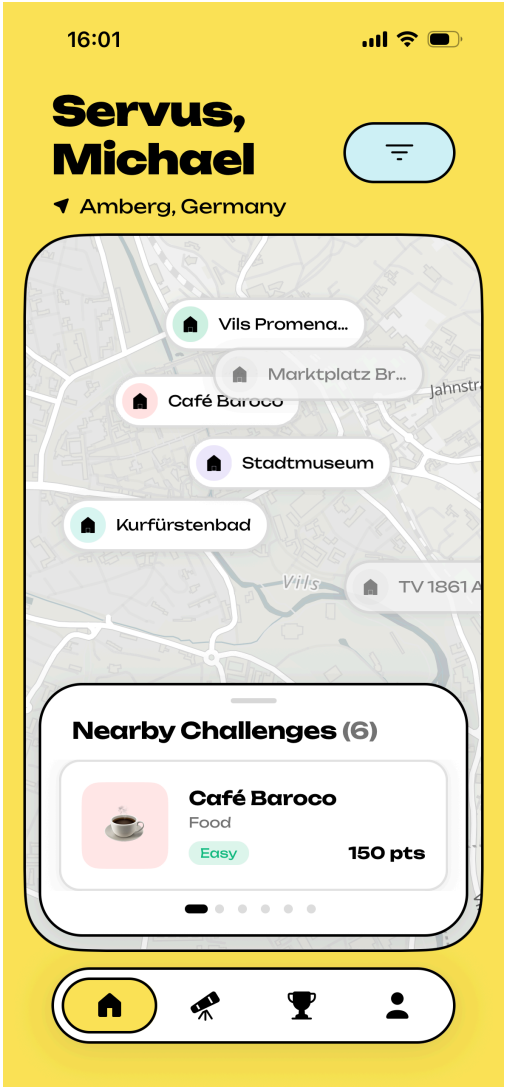

Backend Development: Backend API with routes for Challenges, Users, Companies and Topics, though currently not used by the frontend (`src/backend/src/main`)

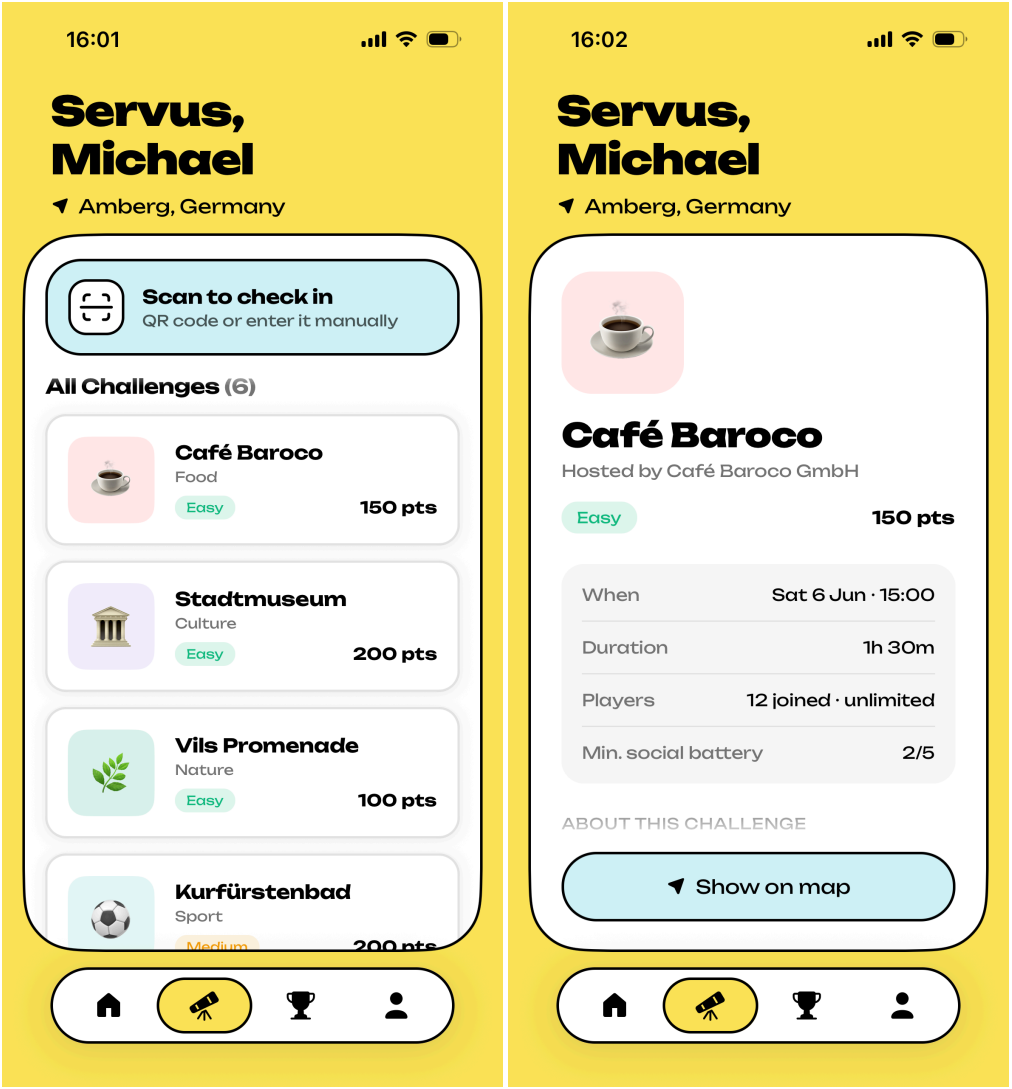

Frontend Development: Frontend with React Native (`src/frontend/src`)
